

Revision on Mini Project 3 – Text Mining and Analysis

The feedback I got from handing in the report was:

“Looks good! In the future, it would be great if you could submit a python script instead of a notebook, because we can't leave inline comments on Jupyter notebooks. Other than that, good documentation and code structure. I appreciated that you took the time to learn about matplotlib.”

For the revision, I have added a document with a python script with my code.

Another small thing I did was to correct something I wrote in my project write up and reflection. I mentioned that I wanted to eliminate the symbols, since my histogram included years and chapter numbers. To solve this, I added this line of code:

```
if word.isalpha():
```

This eliminated the words containing punctuation and numbers, which made my plots a little bit more accurate! A small but important improvement.
